The prices are based on a sample system with one application and serve as a guideline for the required workload. Therefore, the mentioned prices are not binding cost estimates, as they may vary depending on system size, complexity, and additional effort.

A **penetration test** is the best way to **assess the effectiveness of established security measures.**

Test-variants:

Black-Box-Test: Useful for identifying unauthorized access by third parties. The testers have only limited knowledge of the target system and behave like typical hackers to find and exploit vulnerabilities.

White-Box-Test: The testers receive detailed information about the target environment. All potential attack vectors can be identified and examined. Recommended for a comprehensive assessment.

Pentest Phases:

- **Scoping:** Agreement on test content and cases: Discussion of relevant background information.
- **Reconnaissance:** Gathering of information.
- **Enumeration:** Identification of attack vectors.
- **Exploitation:** Exploitation of identified vulnerabilities.
- **Documentation:** Recording of relevant test scenarios, summarizing the test results.

We are happy to create a customized offer tailored to your requirements.
